Data-Driven Marketing 021 1222

The P-values Team

PDF file for the Final Project

Before we start:

- Unfortunately, this file is not converted directly from the .rmd file. we met many issues when copying and pasting each python line into the .rmd file. In addition, r studio was unstable, and many codes which can run in other IDE couldn't run smoothly in the .rmd file. Thus, this file was converted into PDF from multiple VS code files.
- Purpose of the ML, in this case, we are trying to understand the Dynamic aspects of the price today by exploring the Mercari dataset.
- In this project, as mentioned above, the top objective is to understand dynamic pricing.
 ML here is more about helping us to enhance our understanding rather than predicting the price accurately.
- I intended to do the EDA part in Python. However, I found Tableau is surprisingly helpful in this case. Thus, all the charts in the final presentation are done by Tableau.
- Models Considered: Catboost | LGBM | XGB | RNN | CNN
- Models used: LGBM | XGB | RNN | CNN (Catboost was dropped since it requires more than 2 hours to run)
- For RNN model, I got energy from this link: a-simple-nn-solution-with-keras
- For LGBM model, energy: ridge-lgbm, ftrl-fm-lgb, and price-recommendation-tds
- Got some EDA inspiration from: mercari-price-prediction
- I only have limited time to develop these models. There's still a lot of space for improvements, especially in the optimization part.
- Closing thoughts can be found at the very end of this file.
- I hope you will enjoy it, cheers.

Why LightGBM

LightGBM is a gradient boosting framework that uses tree based learning algorithms. It is designed to be distributed and efficient with the following advantages:

- Faster training speed and higher efficiency
- · Lower memory usage
- Better accuracy
- · Parallel and GPU learning supported
- Capable of handling large-scale data

Therefore, we are going to give it a try.

How LightGBM Work

LightGBM is a supported decision tree algorithm, it splits the tree leaf wise with the simplest fit whereas other boosting algorithms split the tree depth wise or level wise instead of leaf-wise.

When growing on an equivalent leaf in Light GBM, the leaf-wise algorithm can reduce more loss than the level-wise algorithm and hence leads to far better accuracy which may rarely be achieved by any of the prevailing boosting algorithms.

It produces far more complex trees by following leaf wise split approach instead of a level-wise approach which is that the main think about achieving higher accuracy. However, it can sometimes cause overfitting which may be avoided by setting the max depth parameter.

Reference: LightGBM Website

Dataset Prep

Content (NN Solutions)

Closing Thoughts:

- Many pages of model files could cause redundancy in this report.
- I intended to build a content-based recommendation engine for this project. However, this may not be related to our objective, plus not sufficient time available.
- Optimization of different models could be the crucial part of this project because we can further simulate price changes in different scenarios, for example, price changes in B2B/B2C, Season Promotion, Inflation, supply and demand situations, and so on. Maybe I will search for more datasets to let this feature happen in the future.
- We chose XGBoost because it took less time to generate results, even though LGBM can offer us better evaluation scores, most optimization service providers (like Intel Optimization Environment) now do not support LGBM. Thus, if this is a real company case, for better future development considerations, XGB is a better choice.
- The library used in the XGBoost model part is xgboost. Unfortunately, this is not ideal since sklearn's xgboost do compatible with more services. For example, SHAP analysis, some evaluation dashboards and interactive web libraries do not support xgboost but sklearn's xgboost. This is one of my regrets after all this finished.
- There's a lot to improve in both the EDA and model parts. Interactive dashboards were built but due to the limitations of the presentation that we can't directly show in class, but hopefully we can be better in the future.

Cheers
